CHAPTER

ONE

WELCOME TO STDCONF'S DOCUMENTATION!

The following is a sample grammar.

productionlist
: This directive is used to enclose a group of productions. Each production is given on a single line and consists of a name, separated by a colon from the following definition. If the definition spans multiple lines, each continuation line must begin with a colon placed at the same column in the first line.

  Blank lines are not allowed within `productionlist` directive arguments.

The following is an example taken from the Python Reference Manual.

```
try_stmt   ::=   try1_stmt | try2_stmt
try1_stmt  ::=   "try" ":" suite
                 ("except" [expression ["," target]] ":" suite)+
                 ["else" ":" suite]
                 ["finally" ":" suite]
try2_stmt  ::=   "try" ":" suite
                 "finally" ":" suite
```

This is plain text.

enumerate(*sequence*[, *start=0*])

Return an iterator that yields tuples of an index and an item of the "sequence". (And so on.)

1.1 Indices and tables

- genindex
- modindex
- search

INDEX

B

built-in function
    enumerate(), 1

E

enumerate()
    built-in function, 1
